Sun atmosphere layers

Photosphere

- collisions dominated: LTE, MHD
- relatively easy observations
- diagnostics techniques well developed

Chromosphere

- not fully collisionally coupled: NLTE, No MHD (frequently not taken into account)
- very few spectral lines
- complicated radiative diagostics

Corona

- magnetically dominated
- very low density
- all ionized, MHD can be applied

2 fluids model

- 13 variables: 10 variables p , ρ and v of the 2 fluids: charges(_c) and neutrals(_n) + magnetic field
- hydrostatic equilibrium(variables: $p_{c0}, p_{n0}, \rho_{c0}, \rho_{n0}, \vec{B}_0$), $\vec{v_{c0}} = \vec{v_{n0}} = 0$
  - charges:

$$\rho_{c0}\vec{g} - \vec{\nabla}p_{c0} + \frac{1}{\mu_0}(\nabla \times \vec{B}_0) \times \vec{B}_0 = 0 \qquad (1)$$

  - neutrals:

$$\rho_{n0}\vec{g} - \vec{\nabla}p_{n0} = 0 \qquad (2)$$

- 13 partial differential equations for the evolution of the perturbation(variables: $p_{c1}, p_{n1}, \vec{v_{c1}}, \vec{v_{n1}}, \rho_{c1}, \rho_{n1}, \vec{B1}$)

Boltzmann equation

$$\frac{\partial f_\alpha}{\partial t} + \vec{v} \cdot \vec{\nabla} f_\alpha - \vec{a} \cdot \vec{\nabla}_v f_\alpha = (\frac{\partial f_\alpha}{\partial t})_{coll} \tag{3}$$

with $\alpha \in i, e, n$ (charges = e+i)

radiation not taken into account

single ionized H plasma ($n_i = n_e$)

collision terms: $C_\alpha \stackrel{\text{not}}{=} (\frac{\partial f_\alpha}{\partial t})_{coll} = C_\alpha^{elastic} + C_\alpha^{inelastic}$

In order to calculate the 0th, first and second moment of Boltzmann equation we need to calculate

$S_\alpha \stackrel{\text{not}}{=} \int_V C_\alpha d^3\vec{v}$

$\vec{R_\alpha} \stackrel{\text{not}}{=} \int_V \vec{v} C_\alpha d^3\vec{v}$

$M_\alpha \stackrel{\text{not}}{=} \int_V v^2 C_\alpha d^3\vec{v}$

Collision terms(inelastic)

$C_\alpha^{inelastic} = \sum_{\alpha'} \left(n_{\alpha'} C_{\alpha'\alpha}^{inelastic} - n_\alpha C_{\alpha\alpha'}^{inelastic} \right)$

$C_{\alpha\alpha'}^{inelastic} = \sum_\beta C_{\alpha\alpha',\beta}^{inelastic}$

$C_{\alpha\alpha',\beta}^{inelastic} = \sigma_{\alpha\alpha'} f_\beta v_\beta$

where $\sigma_{\alpha\alpha'} = \sigma_{\alpha\alpha'}(v_\beta)$ is the collisional cross section of α and β considering ionization and recombination processes for inelastic collisions:

neutrals:

$C_n^{inelastic} = n_i C^{rec} - n_n C^{ion}$

where $C^{ion} \stackrel{not}{=} C_{ni,e}^{inelastic} = \sigma_{ion} f_e v_e$

$C^{rec} \stackrel{not}{=} C_{in,e}^{inelastic} = \sigma_{rec} f_e v_e$

$\sigma_{ion} \stackrel{not}{=} \sigma_{ni} = \sigma_{ni}(v_e)$

$\sigma_{rec} \stackrel{not}{=} \sigma_{in} = \sigma_{in}(v_e)$

charges:

$C_c^{inelastic} = -C_n^{inelastic}$

Collision terms(inelastic)

0th moment

$S_{\alpha\alpha',\beta}^{inelastic} = \int_V \sigma_{\alpha\alpha'} f_\beta v_\beta d^3\vec{v} = n_\beta < \sigma_{\alpha\alpha'} v_\beta >$

$S^{ion} = n_e < \sigma_{ion} v_e >$

$S^{rec} = n_e < \sigma_{rec} v_e >$

expressions for the collision sections in Leake article:

$< \sigma_{ion} v_e > = \frac{1}{\sqrt{T_e^*}} 2.6 \cdot 10^{-19} m^3/s$

$< \sigma_{rec} v_e > = A \frac{1}{X + \frac{\phi_{ion}}{T_e^*}} (\frac{\phi_{ion}}{T_e^*})^K e^{-\frac{\phi_{ion}}{T_e^*}} m^3/s$

where $\phi_{ion} = 13.6eV$, T_e^* is electron temperature in eV and they define $A = 2.91 \cdot 10^{-14}, K = 0.39, X = 0.232$

$S_n^{inelastic} = n_i S^{rec} - n_n S^{ion}$

Collision terms(inelastic)

First moment

$R_{\alpha\alpha',\beta}^{inelastic} = \int_V \vec{v_\alpha}\sigma_{\alpha\alpha'}f_\beta v_\beta d^3\vec{v}$

$\vec{v_\alpha} = \vec{u_\alpha} + \vec{w_\alpha}$

$\int_V \vec{w_\alpha}\sigma_{\alpha\alpha'}f_\beta v_\beta d^3\vec{v} = 0$

$\int_V \vec{u_\alpha}\sigma_{\alpha\alpha'}f_\beta v_\beta d^3\vec{v} = \vec{u_\alpha}S_{\alpha\alpha',\beta}^{inelastic}$

$R_n^{inelastic} = n_i\vec{u_i}S^{rec} - n_n\vec{u_n}S^{ion}$

Second moment

$M_{\alpha\alpha',\beta}^{inelastic} = \int_V v_\alpha^2\sigma_{\alpha\alpha'}f_\beta v_\beta d^3\vec{v}$

$\int_V u_\alpha^2\sigma_{\alpha\alpha'}f_\beta v_\beta d^3\vec{v} = u_\alpha^2 S_{\alpha\alpha',\beta}^{inelastic}$

$\int_V 2\vec{w_\alpha}\vec{u_\alpha}\sigma_{\alpha\alpha'}f_\beta v_\beta d^3\vec{v} = 0$

$\int_V w_\alpha^2\sigma_{\alpha\alpha'}f_\beta v_\beta d^3\vec{v} = \frac{3k_B T_\alpha}{m_\alpha}S_{\alpha\alpha',\beta}^{inelastic}$

$M_n^{inelastic} = n_i u_i^2 S^{rec} - n_n u_n^2 S^{ion} + 3k_B(\frac{n_i T_i}{m_i}S_{rec} - \frac{n_n T_n}{m_n}S_{ion})$

Collision terms(elastic)

$C_\alpha^{elastic} = \sum_\beta C_{\alpha\beta}^{elastic}$

neutrals:

$C_n^{elastic} = C_{ni}^{elastic} + C_{ne}^{elastic}$

charges:

$C_c^{elastic} = -C_n^{elastic}$

0th moment

$S_\alpha^{elastic} = \int_V C_\alpha^{elastic} d^3\vec{v} = 0$

First moment

$\vec{R_\alpha^{elastic}} = \int_V \vec{v_\alpha} C_\alpha^{elastic} d^3\vec{v} = \int_V \vec{w_\alpha} C_\alpha^{elastic} d^3\vec{v}$

$\int_V \vec{w_\alpha} C_{\alpha\beta}^{elastic} d^3\vec{v} = n_\alpha \nu_{\alpha\beta}(\vec{u_\beta} - \vec{u_\alpha})$ where $\nu_{\alpha\beta}$ is the collision frequency

and for $\alpha \in i, e$ and $\beta = n$ it is expressed as: $n_\beta \sqrt{\frac{8k_B T_{\alpha\beta}}{\pi m_{\alpha\beta}}} \Sigma_{\alpha\beta}$

where $m_{\alpha\beta} = \frac{m_\alpha + m_\beta}{2}$, $T_{\alpha\beta} = \frac{T_\alpha + T_\beta}{2}$ and $\Sigma_{\alpha\beta}$ is the cross section for elastic collisions

$(n_\alpha \nu_{\alpha\beta} = n_\beta \nu_{\beta\alpha})$

$\vec{R_n^{elastic}} = n_i(\nu_{in} + \nu_{en})(\vec{u_c} - \vec{u_n})$

Collision terms(elastic)

$\nu_{in} = n_n \sqrt{\frac{8k_B T_{ni}}{\pi m_{ni}}} \Sigma_{ni}, \ \nu_{en} = n_n \sqrt{\frac{8k_B T_{ne}}{\pi m_{ne}}} \Sigma_{ne}$

and we use the values: $\Sigma_{ne} = 10^{-19} m^2, \Sigma_{ni} = 5 \cdot 10^{-19} m^2$

Second moment

$M_\alpha^{elastic} = \int_V v_\alpha^2 C_\alpha^{elastic} d^3 \vec{v} = 2 \vec{u_\alpha} \int_V \vec{w_\alpha} C_\alpha^{elastic} d^3 \vec{v} + \int_V w_\alpha^2 C_\alpha^{elastic} d^3 \vec{v}$

We neglect the second term for the moment (braginskii 'heat generation') then:

$M_\alpha^{elastic} = 2 \vec{u_\alpha} \vec{R_\alpha^{elastic}}$

From Boltzmann equation to the evolution of the perturbations

transport equation:

$$\frac{\partial(n_\alpha <\chi>_\alpha)}{\partial t} + \nabla \cdot (n_\alpha <\chi\vec{v}>_\alpha) - n_\alpha <\vec{a}\cdot\vec{\nabla}_v\chi>_\alpha = \int_V \chi(\frac{\partial f_\alpha}{\partial t})_{coll}d^3\vec{v}$$
$$(4)$$

with $\alpha \in n, c$ and $\chi = m_\alpha, m_\alpha\vec{v_\alpha}, \frac{1}{2}m_\alpha v_\alpha^2$ in the Boltzmann transport equation and using the 0th, first and second moment of Boltzmann equation will result in equations for u=$\rho_\alpha, \rho_\alpha\vec{v_\alpha}, \epsilon_\alpha + \frac{1}{2}\rho_\alpha v_\alpha^2$

The equations from the code:

$$\frac{\partial u}{\partial t} + \nabla \cdot \vec{F_u} = S_u \qquad (5)$$

$\vec{F_u} = \vec{F_u}^{id} - \vec{F_u}^{diff}, S_u = S_u^{id} + S_u^{coll} + S_u^{diff}$

Diffusivity(artificial)

Artificial diffusivity coefficients(as in mancha 1 fluid):

$\nu_u^{diff}{}_{x_i} = \nu_u^{diff\_shock}{}_{x_i} + \nu_u^{diff\_const}{}_{x_i} + \nu_u^{diff\_var}{}_{x_i}$ for $i \in 1, 2, 3$

$\nu_u^{diff\_shock}{}_{x_i} = \nu_u^{shock} \cdot max(|\nabla \cdot \vec{v}_u^{shock}|, 0.5) \cdot dx_i^2$ for $\nabla \cdot \vec{v}_u^{shock} < 0$ and 0 otherwise where we define

$\vec{v}_{\rho_{c1}}^{shock} = \vec{v}_{\epsilon_{c1}}^{shock} = \vec{v}_{v_{c1}^{\rightarrow}}^{shock} = \vec{v_{c1}}$, $\vec{v}_{\rho_{n1}}^{shock} = \vec{v}_{\epsilon_{n1}}^{shock} = \vec{v}_{v_{n1}^{\rightarrow}}^{shock} = \vec{v_{n1}}$,

$\vec{v}_{\vec{B}_1}^{shock} = \vec{v}_{c\perp_{\vec{B}}}$ or $\vec{v}_{c\perp_{\vec{B}_0}}$

$\nu_u^{diff\_var}{}_{x_i} = \nu_u^{var}{}_{x_i} \cdot vflow_u \cdot dx_i \cdot hyper_u^{x_i}$

hyper is defined(for example for i = 1):

for each k $\in$ 2..number of points discretized in dimension x_1 - 2:

$hyper_u^{x_i}(k, :, :) = \frac{max(\Delta3_u(k-1,:,:), \Delta3_u(k,:,:), \Delta3_u(k+1,:,:))}{max(\Delta1_u(k-1,:,:), \Delta1_u(k,:,:), \Delta1_u(k+1,:,:))}$ where

$\Delta3_u(k, :, :) = |3(u(k+1, :, :) - u(k, :, :)) - (u(k+2, :, :) - u(k-1, :, :))|$

and $\Delta1_u(k, :, :) = |u(k+1, :, :) - u(k, :, :)|$

(we use T_α for $u = \epsilon_\alpha$ when calculating hyper)

$vflow_u = |\vec{v_{c1}}| + c_{sc} + v_A$ for u related to charges and magnetic field

and $vflow_u = |\vec{v_{n1}}| + c_{sn}$ for u related to neutrals

Diffusivity(artificial)

$\nu_u^{const\_var}{}_{x_i} = \nu_u^{const}{}_{x_i} \cdot vel_u \cdot dx_i \cdot const$

(const is a matrix introduced as a h5 file)

$vel_u = c_{sc} + v_A$ for u related to charges and magnetic field and

$vel_u = c_{sn}$ for u related to neutrals

Fluxes due to the diffusivity:

$F_{\rho_\alpha}^{diff}{}_{x_i} = \nu_{\rho_\alpha}^{diff}{}_{x_i} \cdot \frac{\partial \rho_{\alpha 1}}{\partial x_i}$

$F_{\epsilon_\alpha}^{diff}{}_{x_i} = \rho_\alpha \cdot \nu_{\epsilon_\alpha}^{diff}{}_{x_i} \cdot \frac{\partial T_{\alpha 1}}{\partial x_i}$

symmetric diffusivity matrix for the velocities(artificial viscosity):

$F_{\rho_\alpha v_{\alpha x_j} x_i}^{diff} = \frac{1}{2}\rho_\alpha \cdot (\nu_{\rho_\alpha v_{\alpha x_j} x_i}^{diff} \cdot \frac{\partial v_{\alpha x_j}}{\partial x_i} + \nu_{\rho_\alpha v_{\alpha x_i} x_j}^{diff} \cdot \frac{\partial v_{\alpha x_i}}{\partial x_j})$

magnetic artificial diffusivity:

$E_{x_1}^{artif\_diff} = F_{B_{x_3} x_2}^{diff} - F_{B_{x_2} x_3}^{diff}$, $E_{x_2}^{artif\_diff} = F_{B_{x_1} x_3}^{diff} - F_{B_{x_3} x_1}^{diff}$,

$E_{x_3}^{artif\_diff} = F_{B_{x_2} x_1}^{diff} - F_{B_{x_1} x_2}^{diff}$

where $F_{B_{x_j} x_i}^{diff} = \nu_{B_{x_j} x_i}^{diff} \cdot \frac{\partial B_{x_j}}{\partial x_i}$

Continuity equations

$$F_{\rho_\alpha}^{id} = \rho_\alpha \vec{v_\alpha}$$

$$S'_n \overset{\text{not}}{=} S_{\rho_n}^{coll} = m_H(n_i S^{rec} - n_n S^{ion}) = \rho_c S^{rec} - \rho_n S^{ion}$$

$$S_{\rho_c}^{coll} = -S'_n$$

Momentum equations

symmetric flux matrices:

neutrals

$$F^{id}_{\rho_n v_{n x_i} x_j} = \rho_n v_{n x_j} v_{n x_j}$$

$$F^{id}_{\rho_n v_{n x_i} x_i} = \rho_n v_{n x_j}{}^2 + p_{n1}$$

charges

$$F^{id}_{\rho_n v_{c x_i} x_j} = \rho_n v_{c x_j} v_{c x_j} - \frac{1}{\mu_0}(B_{x_i 0} B_{x_j 1} + B_{x_j 0} B_{x_i 1} + B_{x_i 1} B_{x_j 1})$$

$$F^{id}_{\rho_n v_{c x_i} x_i} = \rho_n v_{c x_j}{}^2 + p_{c1} - \frac{1}{2\mu_0}(B_{x_1 1}(B_{x_1 1} + 2 B_{x_1 0}) + B_{x_2 1}(B_{x_2 1} + 2 B_{x_2 0}) + B_{x_3 1}(B_{x_3 1} + 2 B_{x_3 0}))$$

with gravity: $S^{id}_{\rho_\alpha \vec{v_\alpha}} = -\rho_\alpha \vec{g}$

collision sources:

$$\vec{R'_n} \stackrel{\text{not}}{=} S^{coll}_{\rho_n \vec{v_n}} = m_H(n_i \vec{v_c} S^{rec} - n_n \vec{v_n} S^{ion} + \vec{R_n}^{elastic})$$

$$= \rho_c \vec{v_c} S^{rec} - \rho_n \vec{v_n} S^{ion} + \rho_c \rho_n \alpha^{elastic}(\vec{v_c} - \vec{v_n})$$

where $\alpha^{elastic} \stackrel{\text{not}}{=} \frac{1}{m_n^2}(\sqrt{\frac{8 k_B T_{nc}}{\pi m_{in}}} m_{in} \Sigma_{in} + \sqrt{\frac{8 k_B T_{nc}}{\pi m_{en}}} m_{en} \Sigma_{en})$

$$S^{coll}_{\rho_c \vec{v_c}} = -\vec{R'_n}$$

Momentum equations

Stiff terms $\rho_c \rho_n \alpha^{elastic}(\vec{v_c} - \vec{v_n})$ calculated as:

$\frac{\rho_c \rho_n \alpha^{elastic} dt}{1 + \alpha^{elastic}(\rho_c + \rho_n) dt}(\vec{v_c} - \vec{v_n})$

Total energy equations

$E_c = \epsilon_c + \frac{1}{2}\rho_c v_c^2 + \frac{1}{2\mu_0}B^2$

$E_n = \epsilon_n + \frac{1}{2}\rho_n v_n^2$

$\vec{F}_{E_c}^{id} = (E_c + p_c + \frac{B^2}{2\mu_0})\vec{v_c} - \frac{1}{\mu_0}(\vec{v_c} \cdot \vec{B})\vec{B}$

$\vec{F}_{E_n}^{id} = (E_n + p_n)\vec{v_n}$

with gravity: $S_{E_\alpha}^{id} = \rho_\alpha \vec{v_\alpha}\vec{g}$

$S_{E_n}^{coll} = M_n'^{\ inelastic} + m_H \vec{v_n}\vec{R_n}^{\ elastic}$

where

$M_n'^{\ inelastic} \overset{\mathrm{not}}{=} m_H(\frac{1}{2}n_i v_c^2 S^{rec} - \frac{1}{2}n_n v_n^2 S^{ion} + \frac{3}{2}k_B(\frac{n_i T_c}{m_i}S_{rec} - \frac{n_n T_n}{m_n}S_{ion}))$

$= \frac{1}{2}\rho_c v_c^2 S^{rec} - \frac{1}{2}\rho_n v_n^2 S^{ion} + \frac{3k_B}{2m_H}(\rho_c T_c S_{rec} - \rho_n T_n S_{ion})$

$S_{E_c}^{coll} = -M_n'^{\ inelastic} + m_H \vec{v_c}\vec{R_n}^{\ elastic}$

$\vec{F}_{E_\alpha}^{diff} = \vec{F}_{\epsilon_\alpha}^{diff} - \frac{1}{\mu_0}\vec{E}^{diff} \times \vec{B} + \bar{\bar{F}}_{\rho_n \vec{v_\alpha}}^{diff} \cdot \vec{v_\alpha}$

Internal energy equations

internal energy $\epsilon_\alpha = \frac{p_\alpha}{\gamma - 1}$ (If we take into account the ionization energy:
$\epsilon_c = \frac{p_c}{\gamma - 1} + n_e \phi_{ion}$)

$\vec{F}_{\epsilon_\alpha}^{id} = \epsilon_\alpha \vec{v_\alpha}$

$S_{\epsilon_\alpha}^{id} = p_\alpha \nabla \cdot \vec{v_\alpha}$

$S_{\epsilon_n}^{coll} = S_{E_n}^{coll} - \vec{R'_n} \cdot \vec{v_n} + \frac{1}{2} v_n^2 S'_n$

$S_{\epsilon_c}^{coll} = S_{E_c}^{coll} + \vec{R'_n} \cdot \vec{v_c} - \frac{1}{2} v_c^2 S'_n$

$S_{\epsilon_c}^{diff} = \vec{j} \cdot \vec{E}^{diff}$

Ohm law and induction equation

$\vec{E} = -\vec{v} \times \vec{B} - \vec{E}^{artif\_diff} + \vec{E}^{plasma\_diff}$

$\vec{E}^{plasma\_diff} = \nu_c \vec{j} + c_{jb}\vec{j} \times \vec{B} - c_{jb}\vec{\nabla}p_e + \nu_A(\vec{v_n} - \vec{v_c})$

where $\nu_C = \frac{m_e(\nu_{ei}+\nu_{en})}{n_e q_e^2}$, $\nu_A = \frac{m_e(\nu_{en}-\nu_{in})}{q_e}$, $c_{jb} = \frac{1}{n_e q_e}$

$\nu_{ei} = n_e \Lambda_C T_{nc}^{-\frac{3}{2}} 3.7 \cdot 10^{-6}$, $\Lambda_C = 23.4 - 1.15log_{10}(n_e) + 3.45log_{10}(\frac{T_{cn}k_B}{q_e})$

evolution of magnetic field:

$\frac{\partial B_1}{\partial t} = -\nabla \times \vec{E}$

Orszag test

extended from mancha 1 fluid test
no collision terms, variable artificial diffusivity and filtering
Initial conditions:

Acoustic Wave

extended from mancha 1 fluid test **Initial conditions**:
hydrostatic equilibrium in an isothermal gravity stratified
atmosphere:
$\vec{B_0} = (0, 0, B_{z0})$, $B_{z0} = 50 \cdot 10^{-4}$ T, $\nabla \times \vec{B_0} = 0$
$\frac{\partial p_\alpha}{\partial z} = -\rho_\alpha g$
we define total pressure at the base $p_{00} = p_0(z = 0) = 1.17 \cdot 10^4$ Pa and
uniform temperature equal for neutrals and charges: $T_0 = 10000$ K
assuming hydrogen plasma we calculate from Saha equation the
pressure of neutrals and charges at the base: p_{n00}, p_{c00}
we have different pressure scale heights for charges and neutrals:
$H_\alpha = \frac{RT_0}{\mu_\alpha g}$ beacuse of different $\mu_c = \frac{1}{2}\mu_n$ and $\mu_n = 1g/mol$ (only H)
we calculate then equilibrium pressure of charges and neutrals:
$p_{\alpha0}(z) = p_{\alpha00}exp(-\frac{z}{H_\alpha})$
and density from ideal gas law: $\rho_\alpha = \frac{p_\alpha \mu_\alpha}{RT_0}$

Acoustic Wave

perturbation - a gaussian shaped(in the xy plane) sound wave generated permanently at the base of the gravity stratified atmosphere: we specify the amplitude A=100, the period P=50 ($\omega = \frac{2\pi}{P}$) of the wave, x_0, y_0, σ_x, σ_y the center and the standard deviation of the gaussian and z_f the end of the perturbed region

the cutoff frequency: $\omega_{c\alpha} = \frac{\gamma g}{2c_{s\alpha}}$

the pressure scale height: $H_\alpha = \frac{c_{s\alpha}^2}{\gamma g}$

$$k = \begin{cases} -\frac{\sqrt{\omega^2-\omega_c^2}}{c_{s\alpha}} - \frac{i}{2H_\alpha} & \omega \geq \omega_c \\ i(\frac{\sqrt{\omega^2-\omega_c^2}}{c_{s\alpha}} - \frac{1}{2H_\alpha}) & \omega < \omega_c \end{cases}$$

$g = exp(-\frac{(x-x_0)^2}{2\sigma_x^2} - \frac{(y-y_0)^2}{2\sigma_y^2})$

$rr = \frac{1}{\omega}(-k - \frac{i}{H})$

$pp = \frac{1}{\omega}(-k\gamma - \frac{i}{H})$

Acoustic Wave

$p_{\alpha 1}(x, y, z) = A \cdot g(x, y) \cdot pe_{\alpha 0}|pp|exp(Im(k)(z_f - z))sin(Re(k)(z_f - z) + \omega t + atan(\frac{Im(pp)}{Re(pp)}))$

$\rho_{\alpha 1}(x, y, z) =$
$A \cdot g(x, y) \cdot \rho_{\alpha 0}|rr|exp(Im(k)(z_f - z))sin(Re(k)(z_f - z) + \omega t + atan(\frac{Im(rr)}{Re(rr)}))$

$v_{\alpha 1}(x, y, z) = A \cdot g(x, y)exp(Im(k)(z_f - z))sin(Re(k)(z_f - z) + \omega t))$

in this test we used a Perfectly Matched Layer to avoid reflection at the upper boundary (described in previous version of Mancha)

for S^{ion} and S^{rec} instead of expression in Leake the derivation of Saha equation in time (only derivating T and not n_{tot}):

$\frac{\partial n_e}{\partial t} = ((\frac{2\pi m_e k_B}{h^2})^{1.5}\frac{\partial T_{cn}}{\partial t}exp(-\frac{\phi_{ion}}{k_B T_{cn}})(1.5\sqrt{T_{cn}} + \frac{\phi_{ion}}{k_B T_{cn}^2})(\frac{2A + n_{tot}}{2\sqrt{A^2 + An_{tot}}} - 1)min(\frac{dt}{te\_relaxation\_timescale}, 1)$

where $A = (\frac{2\pi m_e k_B T_{cn}}{h^2})^{1.5}exp(-\frac{\phi_{ion}}{(k_B T_{cn}})$

and te_relaxation_timescale is the relaxation time for saha: parameter set to 10 in this test

Acoustic Wave

where$(\frac{\partial n_e}{\partial t} < 0)$ $S^{rec} = -\frac{1}{\rho_c}\frac{\partial n_e}{\partial t}$, $S^{ion} = 0$

elsewhere $S^{ion} = \frac{1}{\rho_n}\frac{\partial n_e}{\partial t}$, $S^{rec} = 0$

Reconnection
